cc method of the invention. The plasmid contains an adenovirus type 5 (E4 regulatory gene and a hygromycin resistant gene. The invention cc provides adenoviral vectors having deletions of all or part of carlous gene sequences encoding adenoviral structural proteins. CC Deletions in the structural proteins would allow a reduced risk of cc wild type virus contamination and would also allow packaging of foreign CC DNA in such vectors for a variety of diagnostic and therapeutic CC applications. The adenoviral vectors having deletions in the structural cc gene regions are produced by cellular complementation of these cc adenoviral genes. Therefore, the pE4/Hygro plasmid was used as a cc complementation plasmid which was introduced into a host cell line complementation plasmid which was introduced into a host cell line complementation plasmid which was introduced into a host cell line complementation plasmid which was introduced into a host cell line complementation plasmid which was introduced into a host cell line complementation plasmid who was used as a gene delivery vector. The vectors can be used for diagnosis or cg gene therapy, e.g. for treating conditions characterised by the cc gene therapy, e.g. for treating conditions characterised by the cc. Huntington's disease, Tay-Sachs disease, or sickle cell disease), or cc production of biologically active proteins.

PT Adenoviral vectors - which lack DNA encoding for structural protein

PT or fibre protein used particularly for gene therapy

PS Example 1; Pages 131-145; 170pp; English.

CC The present sequence is that of a pE4/Fiber plasmid used in the

CC method of the invention. The plasmid contains an adenovirus type 5 (AD5)

CC fiber gene controlled by a CMV promater, an AD5 E4 gene and an adenovirus

CC type 2 (AD2) tripartite leader sequence upstream of the fiber gene. The

CC various gene sequences encoding adenoviral structural proteins and/or

CC various gene sequences encoding adenoviral structural proteins and/or

CC early region proteins. Deletions in these proteins would allow a

CC cearly region proteins. Deletions in these proteins would also allow

CC packaging of foreign DNA in such vectors for a variety of diagnostic and

The adenoviral vectors having deletions in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chimeric - N
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        complementation of these adenoviral genes. Therefore, the pE4/Fiber plasmid was used as a complementation plasmid which was introduced into a host cell line where parts of the fiber and E4 gene region would be stably inserted into the host cell chromosomes. The resulting E4/fiber gene deficient plasmid can be used as a gene delivery vector. The vectors can be used for diagnosis or gene therapy, e.g. for treating conditions characterised by hyper-proliferative cells (e.g. tumours), genetic diseases (e.g. Huntington's disease, Tay-Sachs disease, or sickle cell disease), or infections (e.g. HIV infection). They can also be used for in vitro production of biologically active proteins ceused for in vitro production of biologically active proteins.
and durable transgene expression

Example 2; Fig 10A-H; 74pp; English.

This is the DNA sequence of the recombinant adenovirus

H5.020TKneo-int. It was obtained by co-transfecting HEK293 (ATCC CRL1573) cells with linearised plasmid padneo-int (see T60555) and Ad5d17001. It was used as a control in studies of the retrotransposition and integration of cis- and trans-acting recombinant adenoviruses (see T60557 and T60558) into host cells. Claimed novel recombinant replication defective viruses (A) comprise: (a) DNA of, or corresponding to, at least part of the viral genome, able to infect a mammalian cell; and (b) a first
                                                                                                                                                                                                                                                                                                                                                                                   01-MAY 1997.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    멍
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            expression sequence (ES1) comprising a human gene (I) linked to regulatory sequences for expression, with the cassette flanked by the cis-acting terminal repeat sequences of a transposon, and ES1 flanked by DNA of (a); (A) can infect a mammalian cell and can express (I) and transfer it to the cellular chromatin in vivo or in vitro in the presence of a transposase. Also new are: (1) a recombinant replication defective virus (B) containing (a) as above and a second expression sequence (ES2) containing a trans-acting transposase gene (II) plus regulatory sequences, flanked by DNA of (a) and able to express transposase in mammalian cells; and (2) mammalian cells which stably express (I) integrated into its chromatin, produced by infection with (A). (A) and (B) are used for delivery and stable integration of (I) into a host cell (claimed), e.g. in somatic gene therapy of genetic defects or deficiencies such as cystic fibrosis. (A) are also used to prepare recombinant retroviruses (RRV) (claimed). Because (I) becomes stably integrated, it provides longer lasting expression than genes introduced with conventional adenoviral vectors and the need for repeated administration is avoided. The transgene is inherited by the cells. When used for RRV production, (A) increase the ratio of RRV to empty retrovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

FS Claim 45; Page 87-102; 139pp; English.

CC This nucleotide sequence comprises plasmid pBHG11 that consists of CC and 5 (see also V07258) from bp 188-1339 (0.5-3.7 m.u.). This deletion removes the packaging signals as well as El sequences. CC pBHG11 also contains a large deletion within the E3 region (bp CC 27865-30995, 77.5-86.2 m.u.). Mucleotide 873 of pBHG11 is equivalent to nucleotide 7269 of Ad5. The large E3 deletion CC provides a large cloning capacity to Ad vectors based on pBHG11. CC Recombinant plasmids pdelpol and pBHG11delpol (deleted for E1 and CC polymerase functions), and pAXBdelpoldelpTVARNA+t13 and CC polymerase functions), and pAXBdelpoldelpTVARNA+t13 and CC preterminal protein functions), are specifically claimed. The CC invention provides improved adenoviral vectors and packaging CC within the E3D region of the adenoviral genome (see also V07261). CC These E2D-deleted virus are used in conjunction with novel cell (CC vittin the E3D region of the adenoviral genome (see also V07261). CC significations permit the transfer of large genes (e.g. up to CC provide improved adenoviral genome (see also V07261). These E2D-deleted for E1 viral coding regions. These CC grutted vectors permit the transfer of large genes (e.g. up to CC provide improved adenoviral genome (see also V07261). These E2D region of the E2D-deleted and gutted vectors of CC provide improved adenoviral vectors useful for a wide variety of CC gene therapy applications.

200 gene therapy applications.

201 gene to the muscle of mice. The E2D-deleted and gutted vectors of CC gene therapy applications.

202 gene therapy applications.

Example 2; Fig 8A-1; 74pp; English.

CThis is the DNA sequence of the cis-acting recombinant adenovirus CC His-0207kneo-int(LTR). It was obtained by co-transfecting HEX293 CC (ATCC CRL1573) cells with linearised plasmid pAdMLVneo-int (198e 760554) and Ad5617001. A trans-acting adenovirus (see CC F00558) was also produced, and retrottransposition and integration cc viruses. Claimed novel recombinant replication defective viruses (A) comprise: (A) DNA of, or corresponding to, at least part of the CC viruses. Claimed novel recombinant replication defective viruses (C) the cis-acting terminal repeat sequences of a transposon, and ESI CC expression sequence (ESI) comprising a human gene (I) linked to regulatory sequences for expression, with the cassette flanked by the cis-acting terminal repeat sequences of a transposon, and ESI CC express (I) and transfer it to the cellular chromatin vivo or in CC express (I) and transfer it to the cellular chromatin vivo or in CC transposase gene (II) plus regulatory sequences, flanked by DNA of (A); (A) can infect a mammalian cell; and (2) mammalian cells which stably express (I) integrated into its chromatin, produced by infection with (A). (A) are also used to express transposase (I) integrated into its chromatin, produced by infection with (A). (A) are also used to prepare (C claimed), e.g. in somatic gene therapy of genetic defects or deficiencies such as cystic fibrosis. (A) are also used to prepare (C claimed) integrated, it provides longer lasting expression than genes culturoduced with conventional adenoviral vectors and the need for cepatated administration is avoided. The transgene is inherited by the coll control of the viral component is gradually degraded by the cccl.
                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                         New adenoviral recombinant plasmid(s) - comprise sequences provided for expression of large foreign DNA fragments, used for, e.g. gene therapy of genetic disease(s)

Disclosure; Page 69-86; 139pp; English.

This nucleotide sequence comprises the adenovirus 5 (Ad5) genome. The invention provides improved adenoviral vectors and packaging cell lines. One type of improved vector comprises deletions within the E2b region of the adenoviral genome (see also V07261). These E2b-deleted virus are used in conjunction with novel cell lines that constitutively express E2b gene products. The invention also provides vectors deleted for all viral coding regions. These (suptous provides vectors deleted for all viral coding regions. These (gutted vectors permit the transfer of large genes (e.g. up to the muscle of mice. The E2b-deleted and gutted vectors gene to the muscle of mice. The E2b-deleted and gutted vectors gene to the muscle of mice. The E2b-deleted and gutted vectors gene therapy applications.

Example 2; Fig 9A-1; 74pp; English.

CC This is the DNA sequence of the trans-acting recombinant adenovirus

CC H5.020CMygag-pol. It was obtained by co-transfecting HEK293

CC (ANCC CRL1573) cells with linearised plasmid pAdCMygag-pol (see

CC T60555) and Ad5d17001. A cis-acting adenovirus (see T60557) was

CC calls was demonstrated in HeLa cells infected, with both yiruses.

CC claimed novel recombinant replication and integration into host

CC comprise: (a) DNA of, or corresponding to at least part of the

CC viral genome, able to infect a mammalian cell; and (b) a first

CC viral genome, able to infect a mammalian cell; and (b) a first

CC viral genome, able to infect a mammalian cell; and (b) a first

CC viral genome, able to infect a mammalian cell; and (b) a first

CC viral genome, able to infect a mammalian cell; and (b) a first

CC viral genome, able to infect a mammalian cell; and (b) a first

CC viral genome, able to infect a mammalian cell; and (b) a first

CC viral genome, able to first to the cellular chromatin in vivo or in

CC viral genome, able to first to the cellular chromatin in vivo or in

CC viral genome, and transfer it to the cellular chromatin in vivo or in

CC viral genome, and transfer it to the cellular chromatin in vivo or in

CC viral genome, and transfer it to the cellular chromatin in vivo or in

CC viral genome, and transfer it to the cellular chromatin in vivo or in

CC viral genome, and transfer it to the cellular chromatin in vivo or in

CC viral genome, and transfer it to the cellular chromatin in vivo or in

CC viral genome, and transfer it to the cellular chromatin in vivo or in

CC viral genome, and transfer it to the cellular chromatin in vivo or in

CC viral genome (II) plus regulatory sequences, flanked by

CC and a second expression sequence (ES2) containing a las above

CC and a second expression sequence (ES2) containing a las above

CC and able to express transposase in mammalian cells; and (2)

CC and able to express transposase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
Example 10; Fig 28A, XX; 126pp; English.

CC This is the nucleotide sequence of vector 231-10, a human cadenovirus serotype 5 (Ad5) vector. 231-10 lacks the E1A, E1B cc and E3 transcription units. The deleted E1A and E1B regions are creplaced with an expression cassette wherein all the E3 proteins care expressed from the human cytomegalovirus (CMV) promoter. The CC are expression cassette contains the E3 genes from virus pm734.1, CC a derivative of virus rec700, which is an Ad5-Ad2-Ad recombinant ct that has the Ad2 version of the E3 genes for the 12.5K, 6.7K, CT that has the Ad2 version of the E3 genes for the 12.5K, 6.7K, CT that has the Ad2 version of the E3 genes for the 12.5K, 6.7K, CT that has the Ad2 version of the E3 genes for the 2.5K, 6.7K, CT that has the Ad2 version of the E3 genes for the 2.5K, 6.7K, CT that has the Ad2 version of the E3 genes for the E3 genes cc for the RID-beta and 14.7K proteins. In addition, the vector has cc missense mutations in the adp (adenovirus death protein) gene cc that eliminate the first 2 Met codons, thereby precluding synthesis cof functional ADP. Because 231-10 lacks E1A, viral genes in the CC vector backbone are not expressed; only the E3 proteins are expressed from the CMV promoter. Thus, the vector serves as an cc expressed from the CMV promoter. Thus, the vector serves as an cc expressed from the CMV promoter. Thus, the vector serves as an cc expressing a death receptor of the tumour necrosis factor creceptor family. This involves treating the cells with a receptor internalisation and degradation (RID) protein complex containing cell can be treated by administering to the cell a polynuclectide complex. The compositions and methods are used to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          34825
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 34885
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   34945
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chimeric - Mastadenovirus 5.
Chimeric - Mastadenovirus 2.
Chimeric - Human cytomegalovirus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                degenerative immunodeficiency diseases, particularly to decrease leukocyte apoptosis (claimed). Immune disorders that can be treated include autoimmune disorders, ischaemic injury such as caused by myocardial infarction, stroke induced neuron death and reperfusion injury, alcohol-induced hepatitis, diseases caused by viral infection such as AIDS and fulminant hepatitis, and cancer. The methods can also be used to promote tissue transplant survival. Vector 231-10 can be used to deliver the RID complex to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure: Pages 70-89; 116pp; English.

The sequence is that of the chimpanzee adenovirus C68. It may used in the production of a vector comprising it and a select heterologous gene operatively linked to regulatory sequences directing its expression in a heterologous cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Such recombinant adenoviruses are useful as vectors in gene therapy and genetic engineering in general, especially for the treatment of aquired or genetically inherited defects. The viruses are also useful for the in vitro production of recombinant proteins of interest.

                                                                                       33934
                                                                                                                                                                                                                                                                                                   theterologous gene operatively linked to regulatory sequences directing its expression in a heterologous cell. Such recombinant adenoviruses are useful as vectors in gene therapy and genetic engineering in general, especially for the treatment of aquired or genetically inherited defects.
                                                                                                                                                                                                                                                            the treatment of aquired or genetically inherited defects. The viruses are also useful for the in vitro production of recombinant proteins of interest.

Adenovirus based gene therapy vectors - esp. useful for gene Adenovirus based gene therapy vectors - esp. useful for gene Adenovirus vector named Ad2-ORF6/PGK-CFTR. This virus lacks El and in its calcaloration adenovirus vector named Ad2-ORF6/PGK-CFTR. This virus lacks El and in its calcaloration vector named Ad2-ORF6/PGK-CFTR. This virus lacks El and in its calcaloration vector named Ad2-ORF6/PGK-CFTR. This virus lacks El and in its calcaloration vector named Ad2-ORF6/PGK-CFTR, this virus lacks El and in its calcaloration vector named Ad2-ORF6/PGK-CFTR, const. The EA region of the Vactor has also been modified to fibrosis transmembrane condutance regulator (CFTR) conMa. The PGK calcalorate strength but it is long lasting and is not construct to shut off. The EA region of the vactor has also been modified in that the whole sequence has been removed and replace by ORF6, the construct comprises a full length copy of the Ad2 genome from the DNA construct comprises a full length copy of the Ad2 genome from the CC which the early region 1 genes (El genes) have been deleted and replaced by an expression cassette encoding CFTR. The expression cassette conductes the promoter for PGK and a poly-A addition signal from the CC includes the promoter for PGK and a poly-A addition signal directly construct differs and constructed the the pulmostry allocation signal directly constructed the pulmostry allocation signal directly constructed the pulmostry allocation signal directly constructed the pulmostry allocation signal directly constructed the pulmostry allocation signal directly constructed the pulmostry allocation signal directly constructed the pulmostry allocation signal directly constructed the pulmostry allocation signal directly constructed the pulmostry allocation signal directly constructed the pulmostry allocation signal directly constructed the pulmostry allocation signal directly constructed the pulmostry allocation signal directly constructed the pulmostry signal constructed the pulmostry signal constructed the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ဥ္ပင္သ
PT Recombinant adeno-associated virus contg. second gene which from the facilitates its conversion from single stranded to double stranded the facilitates its conversion from single stranded to double stranded for virus - enhances efficiency of ex vivo transduction into target cell for virus - enhances efficiency of ex vivo transduction into target cell for the facilitation of the mouse manmary tumour virus promoter and a growth hormone control of the mouse manmary tumour virus promoter and a growth hormone terminator sequence. The minigene is used to generate a packaging cell line expressing the 24 ORFS product which is used to rescue and package comprises at least 2 selected genes, the first gene able to express the comprises at least 2 selected genes, the first gene able to convert the single stranded virus to its double stranded gene able to convert the single stranded virus to its double stranded form upon expression. The rAAV is useful in pharmaceutical compositions for use in ex vivo and convert convert convert the target convert the target convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert convert conver

Recombinant adeno-associated virus contg. second gene which facilitates its conversion from single stranded to double stranded virus - enhances efficiency of ex vivo transduction into target cell Example 19; Page 108-114; 131pp; English.

This is the nucleotide sequence of a second generation of recombinant adeno-associated virus (rAAV) which contains 2 genes, the first gene able to express the gene of interest (beta-galactosidase) in the target cell; and the second gene(AdS 24 ORF6) able to convert the single stranded virus to its double stranded form upon expression. The rAAV is useful in pharmaceutical compositions for use in ex vivo and in vivo gene therapy for the treatment of inherited diseases, cancer and other genetic dysfunctions, e.g. cystic fibrosis.
